An apparatus is described for converting heat energy into electrical energy. A heat source (2) produces heat radiation of a broad band spectrum. A rare earth (Ytterbia/Erbia) selective emitter (4) absorbs the heat radiation from the heat source and reradiates narrow band radiation. The narrow band radiation is absorbed by thermophotovoltaic cells (6) that contain multiple quantum well structures and convert the narrow band radiation into electrical energy. 1 December 1997
